Proprietary Information

Agenda:

1. Idea of Monte Carlo Simulation
2. A few examples
3. Pitfalls
4. Mu Sigma artifact

## Idea of randomness

Find the area of any shape:
It is very difficult to use calculus to find the area of an object such as the one shown to the right.

But using the Monte Carlo Method it's easy.

## Just find the relative frequency

Box it.

Hit it randomly

Find the proportion of hits
This proportion times the area of the box must be an indicator of the are of the image.

## More trials

- Probably This is better than the previous.

## Monte-Carlo Techniques

- Problem: What is the probability that 10 dice throws add up exactly to 32 ?
- Exact Way. Calculate this exactly by counting all possible ways of making 32 from 10 dice.
- Approximate (Lazy) Way. Simulate throwing the dice (say 500 times), count the number of times the results add up to 32 , and divide this by 500 .
- Lazy Way can get quite close to the correct answer quite quickly.

Monte Carlo simulation: technique that combines distributions with random number generation

## Random numbers

can be generated
in different ways

Best way to relate random number to a variable is to use cumulative probability distribution
(probability density functions - pdf)

The daily demand for clone packs (80 seedlings) during Spring months was studied and the probabilities are the following:

| Relative frequencies (probability) |  | If the distribution is known, WHY do we use random numbers to simulate it? <br> $\downarrow$ <br> BECAUSE, although the |
| :---: | :---: | :---: |
|  |  |  |
| Nr packs ordered | probability | BECAUSE, although the probability is known (the relative |
| 0 | 0.05 | frequency of each demand level), |
| 1 | 0.1 | the order of occurrence is not |
| 2 | 0.15 |  |
| 3 | 0.3 |  |
| 4 | 0.25 | It is the order of occurrence (which is |
| 5 | 0.15 | assumed random) which we want to |

Assume that the demand/day is given by:

If the distribution is known, WHY do we use random numbers to simulate it? $\downarrow$
BECAUSE, although the probability is known (the relative frequency of each demand level), the order of occurrence is not

It is the order of occurrence (which is assumed random) which we want to simulate

Sample: a proper subset of the population

Assume that the demand/day is given by:

Relative frequencies (probability)'

If 10000 random numbers were drawn it would be expected that the number of observations per class would be:

| Deman <br> $\mathbf{d}(\mathbf{x})$ | frequencie <br> $\mathbf{s}$ | observations |
| :---: | :---: | :---: |
| 0 | 0.05 | 500 |
| 1 | 0.1 | 1000 |
| 2 | 0.2 | 2000 |
| 3 | 0.3 | 3000 |
| 4 | 0.2 | 2000 |
| 5 | 0.15 | 1500 |

Assume that the demand/day is given by:

Relative frequencies
(probability)

Assume that the demand/day is given by:

| Deman <br> $\mathbf{d}(\mathbf{x})$ | Cumulative <br> probability | Interval for random <br> numbers |
| :---: | :---: | :---: |
| 0 | 0.05 | $0-4$ |
| 1 | 0.15 | $5-14$ |
| 2 | 0.35 | $15-34$ |
| 3 | 0.65 | $35-64$ |
| 4 | 0.85 | $65-84$ |
| 5 | 1 | $85-99$ |

Cumulative frequencies
(probability)

Assume that the demand/day is given by:
Simulate the demand for 10 days

| Demand(x) | Cumulative frequencie s | Interval for random numbers |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | day | Random number | dernand |
| 0 | 05 | 0-4 | 1 |  |  |
|  | 0.15 | 5-14 |  |  |  |
|  |  |  | 3 |  |  |
|  | 0.35 | - 3 | 4 |  |  |
| 3 | 0.65 | 35-64 | 5 |  |  |
| 4 | 0.85 | 65-84 | 6 |  |  |
| 5 | 1 | 85-100 | 7 |  |  |
|  |  |  | 8 |  |  |
|  |  |  | 9 |  |  |
|  |  |  | 10 |  |  |

Assume that the demand/day is given by:
Simulate the demand for 10 days

Assume that the demand/day is given by:
Simulate the demand for 10 days

| Deman <br> $\mathbf{d} \quad \mathbf{( x )}$ | Cumulative <br> frequencie <br> $\mathbf{s}$ | Interval for random <br> numbers |

| 9 | 26 | 2 |
| 10 | 94 | 5 |

## In general, Monte Carlo Simulation is roughly composed of five steps:

1. Set up probability distribution that will be considered in the simulation
2. Build cumulative probability distribution
3. Establish an interval of random numbers for each variable
4. Generate random numbers
5. Simulate trials

Example 2 - Assume the effectiveness function for a system is $\mathrm{W}=5 \mathrm{x}+2 \mathrm{y}+$ $z$, where the variables $x, y$ and $z$ are independent and described by the probabilities below. Run 18 trials

1. Set up probability distributions that will be considered in the simulation

Example 2 - Assume the effectiveness function for a system is $\mathrm{W}=5 \mathrm{x}+2 \mathrm{y}+$ $z$, where the variables $x, y$ and $z$ are independent and described by the probabilities below. Run 18 trials

1. Set up probability distributions that will be considered in the simulation
